In the Claims:

Please amend the claims as follows:

1. (currently amended) A system including at least two manipulators each programmed to carry out a plurality of tasks, the system comprising; comprising:

a controller configured to control the manipulators; and

a handheld control tool for manually manipulating the manipulators, said handheld control tool comprising a communication unit configured to communicate with the control system controller, wherein each manipulator is movably oriented in a first coordinate system, wherein a second coordinate system is defined for each manipulator so that one part of each manipulator stands still in the second coordinate system, and wherein each second coordinate system is movable relative to the first coordinate system, and

wherein the controller is a controller configured to control switch the manipulators between independent movement and synchronized movement and, if synchronized movement is selected, receive information on which such that the manipulators move together in a synchronized motion when one of the manipulators is moved, wherein the control system is configured to select one of said manipulators is selected as a leading manipulator, and which manipulators are to be moved synchronously with the leading manipulator, create a memory list including all remaining manipulators that are to be moved synchronously with the leading manipulator, receive a movement command from the handheld control tool, create a move order for the leading manipulator, based on the received movement command and a current position of the leading manipulator, and create move orders for the remaining manipulators in the memory

list to be moved synchronously with the leading manipulator, such that said parts of the manipulators, which stand still in the second coordinate systems, are moved such that the parts maintain positions relative to the second coordinate system of the leading manipulator, thereby controlling the manipulators such that the manipulators move together in a synchronized motion when the leading manipulator is manually moved utilizing said handheld control tool.

- 2. (previously amended) The system according to claim 1, wherein said hand held control tool comprises a manipulator input member comprising a joystick.
- 3. (currently amended) A method for controlling a system of manipulators including at least two manipulators each controlled by a control system and programmed to carry out a plurality of tasks, wherein each manipulator is movably oriented in a first coordinate system, the system comprising a handheld control tool for manually manipulating the manipulators, said hand held control tool comprising a communication unit configured to communicate with the control system, the method comprising:

defining a second coordinate system for each manipulator so that one part of said manipulator stands still in the second coordinate system, wherein each second coordinate system is movable relative to the first coordinate system,

selecting one of said manipulators as a leading manipulator,

creating a memory list including all manipulators that are to be moved synchronously with the leading manipulator,

receiving a movement command from the hand held control tool, creating a move order for the leading manipulator, based on the received movement

command and a current position of the leading manipulator, and

of the manipulators, which stand still in the second coordinate systems, are moved such that the parts maintain positions relative to the second coordinate system of the leading manipulator, thereby controlling the manipulators such that the manipulators move together in a synchronized motion when one of the manipulators is moved the leading manipulator is manually moved utilizing said handheld control tool.

- 4. (previously amended) The method according to claim 3, wherein said hand held control tool comprises a manipulator input member comprising a joystick creating a movement command by using the joystick.
- 5. (previously presented) The method according to claim 3, wherein the at least two manipulators comprise at least one of robots or external axes.
- 6. (previously presented) The system according to claim 1, wherein the at least two manipulators comprise at least one of robots or external axes.
